

# 10 Reasons To Choose TimeControl with Project 2007

# 1

## **Mixed Environment**

You've deployed an environment that includes a combination of Project Standard, Project Professional and Project Server, or Project Server and other technology such as Primavera, or multiple Project Servers or multiple versions of Project Server such as 2003 and 2007 yet you want a single timesheet system.

# 2

## **Link to Multiple ERP/Finance systems**

TimeControl includes an ability to link to ERP systems such as SAP, Oracle Financials, PeopleSoft and other systems for HR, Payroll and Finance systems such as Microsoft Dynamics.

# 3

## **Expense Reports**

You're not just tracking time, you need to track non-labor costs. TimeControl can support expense reports, materials consumption, equipment usage and more and send that information to both Finance and Project.

# 4

## **Automated Validation Rules**

The timesheet administrator can create multiple levels of electronic validation, beginning with flexible automatic validation rules. Multiple levels of supervisor approval with Debit/Credit and Reject/Authorize capability support HMS Software's unique Matrix Approval Process for Labor Actuals™.

# 5

## **Rates**

TimeControl has an extensive rate system which includes the ability to track both internal and external costs directly. TimeControl tracks not just the hours but also the actual costs of both project and non-project effort and this information can then be used for Governance requirements such as Sarbanes-Oxley, R&D tax claims and more. Rates can also escalate automatically.

# 6

## **Customized fields on every table and a high degree of non-programmer customization**

TimeControl supports a wide range of customization including an unlimited number of fields on every table such as the Rates, Employee, Resource, Project and Task tables as well as inside the timesheet entry itself. These fields can be linked to pop-up lists and then automatically appear in reports, security, exports, imports and more.

# 7

## **TimeControlIndustrial™**

For those organizations that don't have a terminal for each employee such as in an industrial context, TimeControlIndustrial provides a crew entry, Union Labor rates, daily timesheet releases, extended Validation Rules, Materials Management and more.

# 8

## **Deploy to Non-Project personnel**

While TimeControl does include an interface that is displayed directly in Microsoft Project Web Access, it also includes its own interface to deploy to personnel completely outside the project structure.

# 9

## **A single point of entry**

TimeControl's interface manages both the task status and the non-project items in the same interface and our unique Matrix Approval Process for Labor Actuals™ allows the data from that single timesheet to be approved by both Organizational and Project approvers with as many levels as are desired.

# 10

## **Remote Site Synchronization**

TimeControl allows for multiple TimeControl databases to be consolidated using the "TimeControl Consolidator" included with TimeControl Enterprise. This allows remote operations to function without a full-time network connection and then to include that data when a connection can be established or via email.
